AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

Claims 1-18 (canceled)

 (Previously Presented) A state engine receiving multiple requests from a parallel processor for a shared state, the state engine comprising:

at least one state element means, said at least one state element means adapted to operate, atomically, on said shared state in response to a request made by said parallel processor, wherein

said request includes at least a command directing said at least one state element means on how to perform an operation on said shared state; and

a memory connected to said at least one state element means and configured to store said shared state.

20. (Previously Presented) A state engine as claimed in claim 19, wherein the operation performed by said at least one state element means is a single read-modify-write operation.

Attorney's Docket No. <u>0120-034</u> U.S. Application No. <u>10/534,430</u> Page 3

 (Previously Presented) A state engine as claimed in claim 19, wherein said shared state comprises a single item of state.

- (Previously Presented) A state engine as claimed in claim 19, wherein said shared state comprises multiple items of state.
- (Previously Presented) A state engine as claimed in claim 19, wherein said state comprises a single storage location or a data structure in storage.
- 24. (Previously Presented) A state engine as claimed in claim 19, wherein the operation performed by said at least one state element means is carried out as a fixed or hardwired operation.
- (Previously Presented) A state engine as claimed in claim 24, further comprising means to supply data to update said shared state.
- 26. (Previously Presented) A state engine as claimed in claim 24, further comprising means for sending a command and data to said shared state, whereby said operation is programmable.

Attorney's Docket No. 0120-034 U.S. Application No. 10/534,430

comprising a plurality of said state element means organized into state cell means.

(Previously Presented) A state engine as claimed in claim 19, further

whereby operations performed on said shared state are pipelined.

28. (Previously Presented) A state engine as claimed in claim 27, further

comprising a plurality of said state cell means, whereby to allow multiple requests to be

handled concurrently.

27.

29. (Previously Presented) A state engine as claimed in claim 28, further

comprising input and output interconnect means providing access to and from said state

cell means, a bus interface for said input and output interconnect means, said bus

interface interfacing with a system bus and a control unit of a processing element for

controlling accesses to said shared state.

30. (Previously Presented) A state engine as claimed in claim 27, wherein

each said state element means comprises local memory, and each field of a data record

is stored in a respective memory of a respective state element means.

(Previously Presented) A state engine as claimed in claim 19, wherein 31

each said state element means comprises a local memory for said shared state, an

arithmetic unit adapted to perform the operation on said state in said local memory, and command and control logic to control said operation.

32. (Previously Presented) A parallel processor including a state engine, said state engine receiving multiple requests from said parallel processor for a shared state, the state engine comprising:

at least one state element means, said at least one state element means adapted to operate, atomically, on said shared state in response to a request made by said parallel processor, wherein

said request includes at least a command directing said at least one state element means on how to perform an operation on said shared state; and

a memory connected to said at least one state element means and configured to store said shared state.

- (Previously Presented) A parallel processor as claimed in claim 32,
 wherein said parallel processor is an array processor.
- (Previously Presented) A parallel processor as claimed in claim 33,
 wherein said array processor is a SIMD processor.

35. (Previously Presented) A computer system comprising a parallel processor, said parallel processor including a state engine, said state engine receiving multiple requests from said parallel processor for a shared state, the state engine comprising:

at least one state element means, said at least one state element means adapted to operate, atomically, on said shared state in response to a request made by said parallel processor, wherein

said request includes at least a command directing said at least one state element means on how to perform an operation on said shared state; and a memory connected to said at least one state element means and configured to store said shared state

36. (Previously Presented) A network processor comprising a parallel processor, said parallel processor including a state engine, said state engine receiving multiple requests from said parallel processor for a shared state, the state engine comprising:

at least one state element means, said at least one state element means adapted to operate, atomically, on said shared state in response to a request made by said parallel processor, wherein

said request includes at least a command directing said at least one state element means on how to perform an operation on said shared state; and

a memory connected to said at least one state element means and configured to store said shared state.

- (Previously Presented) A parallel processor as claimed in claim 32, implemented on a single silicon chip.
- (Previously Presented) A state engine receiving multiple requests from a parallel processor for a shared state, the state engine comprising:

means for operating, atomically, on said shared state in response to a request made by said parallel processor, wherein

said request includes at least a command directing said means for operating on how to perform an operation on said shared state;

a memory connected to said means for operating and configured to store said shared state; and

means to supply data to update said shared state.

- (New) A state engine as claimed in claim 19, wherein said operation results in a change of said shared state.
- (New) A state engine as claimed in claim 19, wherein said state engine is a programmable entity capable of executing shared memory instructions.

Attorney's Docket No. <u>0120-034</u> U.S. Application No. <u>10/534,430</u> Page 8

- (New) A state engine as claimed in claim 19, wherein said memory is within said state element.
- 42. (New) A state engine as claimed in claim 19, wherein said state engine includes a plurality of state elements which comprise a plurality of local shared memories which provides a composite bandwidth that is a sum of all bandwidths associated with each one of said plurality of local shared memories.
- 43. (New) A state engine as claimed in claim 42, wherein state transactions are processed with said state engine and accesses to shared memory are passed on a system bus.
- 44. (New) A state engine as claimed in claim 42, wherein each of said plurality of state elements includes a single serialization access point resulting in a plurality of serialization access points within said state engine.
- (New) A state engine as claimed in claim 42, wherein said plurality of state elements perform as a plurality of partitioned processing functions.

46. (New) A state engine as claimed in claim 32, further comprising:

a plurality of state engines, wherein one or more of said state engines are applied to a system bus and wherein said one or more of said state engines operate separately from each other.
